

Now we can offer connection of your house to the high-speed internet infrastructure being constructed

When city water and sewage was constructed in nearby Långö/Kråkelund, we applied for a grant to build fiber between the connection point in Lilla Laxemar and the village of Kråkelund. We were too few permanent residents to get funding back then, but during the pandemic we got a chance to update our application. We could then get access to private funding from SKB NU as well as public funding from EU through Landsbygdsprogrammet 2014–2020, which in part is financed by the European Agricultural fund for rural development. This makes it possible to now connect houses in your village to a reasonable cost!

Apply already today! As soon as we have received all answers in a village, we start ordering work and supplies for the construction. An early answer allows for better coordination and a faster date of completion. In order to keep costs at a minimum, you will not receive an invoice. But, you are expected to pay in your dues on your own as soon as your duct/channel is dug up to your property line.

The high-speed internet through fiber allows for low cost, interference-free TV, phone, alarms, and internet connection if so desired. It also increases the value of your property. A comparison shows that our solution has great advantages over other options, both in terms of quality, options, and price. Though, short term it may at first seem like a large investment.
